Title

Ferroelectric phase transition in polycrystalline  $\text{KTaO}_3$  thin film revealed by terahertz spectroscopy

Applied Physics Letters, vol.99, no.5, 1 Aug. 2011, 052908 (3 pp.). Publisher: American Institute of Physics, USA.

Abstract

$\text{KTaO}_3$  single crystal is an archetypal incipient ferroelectric in which a long-range ferroelectric order does not establish at low temperatures owing to quantum fluctuations. We report on a strong evidence of the ferroelectric phase transition near 60 K revealed by terahertz spectroscopy and microwave permittivity measurements of a polycrystalline  $\text{KTaO}_3$  thin film on (0001) sapphire substrate prepared by chemical solution deposition. The soft mode behavior is clearly observed in the terahertz (THz) spectra with a minimum frequency at 60 K. At the same temperature microwave permittivity maximum appears. The THz spectra strongly resemble that of strained epitaxial  $\text{SrTiO}_3/\text{DyScO}_3$  films: the ferroelectric soft mode is linearly coupled to a central peak which is silent in the paraelectric phase and it becomes coupled to the polarization below the ferroelectric transition temperature with a progressively increasing bare strength.
