Abstract:A coherent terahertz needle radiation emission mechanism is proposed. This mechanism can be realised in the experiments on femtosecond laser pulses interacting with surface of nanostructured ferromagnetic metal film. The proposed mechanism is based on exciting of coupled coherent phonon-magnon modes on a nanostructured metal surface by laser femtosecond pulse. The value of the Poynting vector for the terahertz radiation is estimated.

Number of references:5

Inspec controlled terms:ferromagnetism - high-speed optical techniques - laser materials processing - magnetic thin films - metallic thin films - nanostructured materials - phonon-magnon interactions - terahertz wave detectors - terahertz wave generation

Uncontrolled terms:femtosecond laser pulse - coherent terahertz needle radiation emission mechanism - nanostructured ferromagnetic metal film - coupled coherent phonon-magnon modes - Poynting vector

Inspec classification codes:B1350 Microwave circuits and devices

Treatment:Practical (PRA); Theoretical or Mathematical (THR)

Discipline:Electrical/Electronic engineering (B)
